

Homework 1: Introduction to Algorithmic Analysis and Recurrence

Author: Gabriel Hofer

CSC-372 Analysis of Algorithms

Instructor: Dr. Rebenitsch

Section 1 DUE: Thursday, Aug 27th, at 7AM

Section 2 DUE: Thursday, Sept 3 th, at 7AM

Section 2: Recursion Analysis

1) (26 pt) Determine the run time (big-O) for the following recurrence formula using the tree or substitution method. You may use the master method only to check your answer.

$$T(n) = \begin{cases} 1 & n = 1 \\ 2T(\frac{n}{3}) + n^3 & n > 1 \end{cases}$$

We assume or “guess” that the solution is $T(n) = O(n^3 \log(n))$. We want to show that $T(n) \leq d \cdot n^3 \log(n)$ for some constant $d > 0$.

2) (26 pt) Determine the run time (big-O) for the following recurrence formula using the tree or substitution method. You may use the master method only to check your answer.

3) (12 pt) Determine which case of the Master Theorem applies for the following recurrences. Include the values of a, b, and k (and ideally b^k) as proof of your selection. Also, include the final big-theta formula. You also have the option of a recurrence relation that cannot use the master method as described in class, in which case, state it “fails”.

a. $T(n) = 2T(\frac{n}{2}) + \sqrt{n}$
